

SpectraScan™ LD Graphic Converter for PC Draw Images

LD Graphic Converter: PC Draw Program Images Become Laser Images!

Finally with this new, powerful and exciting member of our SpectraScan family of Laser Entertainment software programs, the designer of laser shows is able to transform all the thousands of PC vector graphics into beautiful laser scanned images with just a click of the mouse. Written by our President William Arkin, a recognized expert in the software programming of the LaserShow Designer API, this program converts graphic images created by programs like Corel Draw, Visio, AutoCad, Adobe Illustrator, and HijackPro into the .ldb format of the LD Pro software suite maintaining all the design and color of the original. Now no more drawn out digitizing sessions trying to copy clients logos and then coloring them. In the time it takes for your secretary to pour out the Champagne,

you will have their logo on the laser screen. The vast library of clipart images and animations is now your laser library. Every Window's font is in your font bag including support for operating in foreign alphabets. Do you like the idea of italics or curved text, gradient colors, and depth cued fades? All this is directly made possible with the LD Converter program. Designed on the LD Pro API, this 32-bit modern Win95 program can import any vector graphic image that you want to copy onto the clipboard or you can save images out of any PC drawing program in the native Windows metafile format and load them directly. Then you select your parameters for the conversion, and one click and away the powerful conversion engine goes. The converted .ldb file is a vector file which can be manipulated by the program's local graphic tools like size, rotate, move, flip, and flop or brought into the LD Pro environment for further editing or conversion into point mode. Because it is a vector image, you can set the spacing interval which determines the finesse of the conversion and also the amount of points used. It will even save the file as a series of 3000 point frames if you need to take out small sections at high resolution.

All the Drawing Tools in your PC Available Within LD Converter

An even greater innovation is the use of Microsoft OLE technology just like in the Office Suite. Within the LD Converter, you can host PC drawing programs that support In-Place editing. This includes Corel Draw, Visio, Hijack Sketch, and the new fantastic FutureSplash Animator. Just draw the images you need using these sophisticated tools including bezier curves, select all, click on finished, click on convert, and you have a perfect laser scannable LD image! Finished images can be saved as LD files or loaded into the LD editing environment in the frame number of choice.

Powerful Text Manipulation Environment is an Added Bonus

The LD Converter also includes text tools using the 25 LD resident fonts. Now you can define your text areas with great exactness. Simply draw a box on the viewing window where you want the text contained. You can click on font choices and all the sliders for horizontal and vertical sizing and spacing are right there on the clickable tab settings. Finally, text can be entered in the rich text format with cut and paste, drag-and-drop, or keyboard entry. WhatYouSeeIsWhatYouGet is right in front of you and you can single click for sizing increments up or down of 10%. Are you thinking about text entry with the ease of Word? Well we also support single click alignment for left, right, and centered text. Finally, the program also supports Win95 style help. All you have to do to remind yourself of how a function works, is click the ? and then click the area or command you are uncertain of. The help file comes right up on the screen. Running lasershow has never been this easy or this much fun! This is the tool LaserShow Designers have been dreaming of for a long time.
